Trailblazer spotlight

aegis trailblazers

Wordsworth Excavations

Wordsworth Excavations, a specialist earthworks contractor based in Barnsley, South Yorkshire, is proudly at the forefront of the construction industry's transition to zero-emission transport.

With two Volvo electric HGVs already on the road and plans to grow their EV fleet, Wordsworth are responding to rising demand from construction clients who want sustainable partners.

Craig Lofthouse, Plant Manager at Wordsworth Excavations, says,

"Adding electric HGVs to our fleet has been a source of great excitement for our customers and has led to conversations with construction businesses who are looking for more sustainable partnerships. This is clearly the direction of travel for the industry, and we want to be at the forefront of it."

JOINING THE AEGIS TRAILBLAZERS

Wordsworth Excavations became the first Aegis Trailblazer, joining a community of forward-thinking fleet operators committed to the early adoption of clean refuelling. They have signed a dedicated charging agreement, providing certainty and value as they scale their fleets. They will also access the wide range of benefits that come with being a Trailblazer, including inclusive opportunities to input into hub design and access decarbonisation advice.

With this support, Wordsworth Excavations are exploring how they can electrify more of their fleets and tackle the transition on their own terms. Rather than waiting for regulation to come into force, they are choosing to act now – gaining more time to plan, optimise and position themselves competitively.

Craig says, "***It's refreshing to see Aegis Energy acting now and investing in the future, building clean refuelling hubs that are fit for our needs and located along major transport corridors. The support and influence that comes with being an Aegis Trailblazer will help us expand our electric HGV fleet and explore decarbonising our vans, too.***"
